ABSTRACT

The **Word-Level Plagiarism Checker** is a software application developed to identify similarities between text documents by comparing words, phrases, and sentences. The system preprocesses the input text by removing unnecessary characters, converting the text into a standard format, and dividing it into meaningful words before performing similarity analysis. It employs efficient string matching techniques, including the **Knuth-Morris-Pratt (KMP)** and **Rabin-Karp** algorithms, to detect matching patterns and identify duplicated content across multiple documents.

To improve the accuracy of plagiarism detection, the system uses the **Wagner-Fischer Edit Distance** algorithm to recognize similar words with minor modifications, such as spelling changes or inserted characters. It then performs document similarity analysis to calculate the percentage of matching content and highlights duplicated sections for easy identification. The proposed system provides a fast and reliable approach for detecting plagiarism, making it useful in academic institutions, educational platforms, and content verification applications where maintaining originality and authenticity is essential.
